

Distribution of the outcome and of care intensity

HRS 2022, n = 2,142 respondents receiving any help with ADLs or IADLs. Panel A: informal share = informal care hours / total care hours per month. Panel B is truncated at the physical ceiling of 24 hours x 31 days. The mass at 1.0 in Panel A is why a plain linear model is a poor match and why script 03 fits a two-part specification.
