

Two features move a long way between the two rankings

Features ordered by SHAP rank. A long grey bar means the two methods disagree. `total_care_hours` and `lives_alone` are the two large movers: the first because its relationship to the outcome is non-monotone (very low-intensity help is nearly always informal, very high-intensity help skews formal, the middle is mixed), the second because the three living-arrangement indicators are nearly collinear, so OLS splits the signal between them while the tree assigns it to whichever single indicator splits best.
