

Figure 8. Four real care networks from HRS 2022

Each panel is one respondent's ego network, drawn from their Section G helper records. Edge thickness is monthly care hours. HHI is the Herfindahl concentration of those hours: 1.00 means a single person supplies every hour of care. These four are selected to span the structural range, not sampled at random. The scalar covariates used in scripts 02-04 cannot distinguish the first panel from the second, both are 100% informal, even though one rests on a single person and the other spreads across four.
